this volume attempts to provide accessible accounts of these advances in developmental biology for the non expert together with contributions from hominid palaeontologists which aim to bring this developmental perspective to bear on interpretation of the skeletal record of human evolution this combined approach is as yet in its infancy but it is likely that it will impact significantly on palaeoanthropology and palaeontology in general

does the field of evolution differ from other sciences the author a reviewer for a major medical journal scrutinized hundreds of scientific references in evolutionary literature adopting the same standards used for studies submitted for medical publication the data show that there are two types of evolution microevolution and macroevolution with a clear boundary between them based upon the presence and absence of empirical evidence respectively the surprising results show that there is a universal disconnect between the data and the conclusions that claim to show the larger changes of macroevolution the author reveals patterns of deviations from standard scientific methods in these studies for the first time evolutionary data have been summarized to describe both what evolution can and cannot accomplish the author shows the reader how to recognize the different ways in which the evidence for microevolution within and between some species differs from the unsupported macroevolution of most species previous critiques of macroevolution have been debunked by advocates who have cited a multitude of scientific studies this book goes beyond previous critiques by directly addressing the data from these studies to see if they do in fact support macroevolution focused conclusions many expert counterarguments against this book s thesis are presented and examined in the context of scientific research to reassure the reader that the author has left no stone unturned in the macroevolution debate a theory is proposed as to why there may be no empirical evidence for macroevolution the book concludes with a section entitled what we see differently there the author shows the reader the differences in perspective between the evolutionist and macroevolution critic as they look at and interpret the very same set of data

members of the mammalian clade carnivora have invaded nearly every continent and ocean evolving into bamboo eating pandas

clam eating walruses and of course flesh eating sabre toothed cats with this ecological morphological and taxonomic diversity and a fossil record spanning over sixty million years carnivora has proven to be a model clade for addressing questions of broad evolutionary significance this volume brings together top international scientists with contributions that focus on current advances in our understanding of carnivoran relationships ecomorphology and macroevolutionary patterns topics range from the palaeoecology of the earliest fossil carnivorans to the influences of competition and constraint on diversity and biogeographic distributions several studies address ecomorphological convergences among carnivorans and other mammals with morphometric and finite element analyses while others consider how new molecular and palaeontological data have changed our understanding of carnivoran phylogeny combined these studies also illustrate the diverse suite of approaches and questions in evolutionary biology and palaeontology

this book is an essential anatomical resource for developmental biologists who need to know about any aspect of mouse developmental anatomy as well as for geneticists using the mouse embryo as a model the book is a companion to kaufman s the atlas of mouse development and details the developmental anatomy of the early embryo the transitional tissues and all the major organ systems it also provides extensive comparisons with human developmental anatomy both normal and abnormal the book has extensive reference indexes detailing developmental stage criteria the anatomical basis of mouse development will be a key reference work for anyone who needs to understand developmental anatomy in normal and mutant mice complements kaufman s the atlas of mouse development gives anatomical descriptions from oogenesis to birth at a level of detail that goes beyond that found in most literature provides detailed explanations for geneticists and molecular biologists with limited anatomical background to help them understand the emergence of all the major structures in the mouse embryo contains comprehensive indexes detailing the appearance of over 1000 organs tissues and their components at different stages of mouse embryogenesis includes

comparisons with normal and abnormal human development contains over 100 clear line diagrams showing mouse developmental anatomy as well as lineage relationships for the major organ systems

how did flying birds evolve from running dinosaurs terrestrial trotting tetrapods evolve from swimming fish and whales return to swim in the sea these are some of the great transformations in the 500 million year history of vertebrate life and with the aid of new techniques and approaches across a range of fields work spanning multiple levels of biological organization from dna sequences to organs and the physiology and ecology of whole organisms we are now beginning to unravel the confounding evolutionary mysteries contained in the structure genes and fossil record of every living species this book gathers a diverse team of renowned scientists to capture the excitement of these new discoveries in a collection that is both accessible to students and an important contribution to the future of its field marshaling a range of disciplines from paleobiology to phylogenetics developmental biology ecology and evolutionary biology the contributors attack particular transformations in the head and neck trunk appendages such as fins and limbs and the whole body as well as offer synthetic perspectives illustrated throughout great transformations in vertebrate evolution not only reveals the true origins of whales with legs fish with elbows wrists and necks and feathered dinosaurs but also the relevance to our lives today of these extraordinary narratives of change

the first edition of geometric morphometrics for biologists has been the primary resource for teaching modern geometric methods of shape analysis to biologists who have a stronger background in biology than in multivariate statistics and matrix algebra these geometric methods are appealing to biologists who approach the study of shape from a variety of perspectives from clinical to evolutionary because they incorporate the geometry of organisms throughout the data analysis the second edition of this book retains the emphasis on accessible explanations and the copious illustrations and examples of the first updating the treatment of both theory and practice the second edition represents the current state of the art and adds new examples and summarizes recent literature as well as provides an overview of new software and step by step guidance through details of carrying out the analyses contains updated coverage of methods especially for sampling complex curves and 3d forms and a new chapter on applications of

geometric morphometrics to forensics offers a reorganization of chapters to streamline learning basic concepts presents detailed instructions for conducting analyses with freely available easy to use software provides numerous illustrations including graphical presentations of important theoretical concepts and demonstrations of alternative approaches to presenting results

if you want to know whether evolution is a science how life began what charles darwin really said about evolution why a fungus is more closely related to humans than to a plant how experiments in evolution can be carried out why birds are flying dinosaurs how we manipulate the evolution of other species and if you want a clear treatment of the processes that result in evolution then this is the book for you written for those with a minimal science background evolution principles and processes provides a concise introduction of evolutionary topics for the one term course using an engaging writing style and a wealth of full color illustrations hall covers all topics from the origin of universe earth the origin of life and on to how humans influence the evolution of other species he brings together the principles and processes that explain evolutionary change and discusses the patterns of life that have resulted from the operation of evolution over the past 3 5 billion years this overview coupled with numerous case studies and examples helps readers understand and truly appreciate the origin and diversity of life
